

19 October 2018

Mr Anthony Beasley  
Secretary of the Committee  
Select Committee on the Moratorium on the Cultivation of Genetically Modified Crops in South Australia  
Parliament House  
GPO Box 572  
ADELAIDE SA 5001

By email: [anthony.beasley@parliament.sa.gov.au](mailto:anthony.beasley@parliament.sa.gov.au)

Dear Mr Beasley

**RE: Submission to the Select Committee on the Moratorium on the Cultivation of Genetically Modified Crops in South Australia**

I am pleased to provide the following submission on behalf of the Australian Seed Federation (ASF) to the Select Committee on the Moratorium on the Cultivation of Genetically Modified Crops in South Australia.

The ASF is also pleased to confirm that it is interested in receiving any updates about this consultation.

All correspondence regarding this submission and the consultation process can be addressed to:

Ms Alysha Lockley  
Business Services Manager  
Australian Seed Federation  
PO Box 3572  
MANUKA ACT 2603  
Telephone: 02 6282 6822  
Fax: 02 6282 6922  
Email: [alockley@asf.asn.au](mailto:alockley@asf.asn.au)

If you have any questions do not hesitate to contact me.

Yours sincerely

Alysha Lockley  
Business Services Manager  
Australian Seed Federation

**Australian Seed Federation  
submission to the Select Committee on the  
Moratorium on the Cultivation of  
Genetically Modified Crops in South  
Australia**

**October 2018**

## INTRODUCTION

The Australian Seed Federation (ASF) welcomes the opportunity to provide the following submission to the review of the moratorium on the transport ban growing of genetically modified crops in South Australia.

The ASF is the peak national body representing the interests of Australia's sowing seed industry at the state, national and international levels. The ASF membership base comprises stakeholders from all sectors of the seed supply chain including plant breeders, seed growers, seed processors and seed marketers, all of whom were consulted in the preparation of this submission.

We have a stated position on biotechnology that *'The ASF supports choice in relation to crop biotechnology provided that the choice is based on sound science and respects the rights of others to also choose.'*

In Australia, the seed industry is a vital link in the development of crops that are critical to the country's agricultural productivity, sustainability and food security. The ASF has prepared this submission to highlight the broad affects the South Australia ban on genetically modified crops is having specific to the seed industry, and to support removal of the moratorium.

## KEY POINTS

1. There has been minimal evidence to support the statement that the South Australian moratorium on the cultivation of Genetically Modified Organisms (GMOs) has led to marketing premiums of agricultural produce grown in the State over and above the price in other States in Australia who produce non-GM produce and permit the commercial farming of GMOs.
2. Having the GMO moratorium in place in South Australia is restricting growth and innovation in the State's agricultural sector. It is denying SA growers and farmers access to innovative breeding technologies and new crops/ products both now and in the future, which their competitors in other Australian States have access to.
3. The ASF supports the IMMEDIATE lifting of the South Australian GMO transport ban due to the significant negative implications to the seed and agriculture industry. For example, the increased cost to seed producers and long delays resulting in having to use other transportation measures diverting genetically modified seed around South Australia.

## GENETICALLY MODIFIED CROPS AND PLANT BREEDING

Plant breeding depends upon genetic variability within and across related species as a basis for developing new plant varieties with improved characteristics. To create a new plant variety, plant breeders have generally relied on two sources of genetic variation as a basis for new characteristics: the inherent diversity in a plant's gene pool and new, naturally occurring variants of existing genes.

Plant breeders have always used the creation of new variations of plant characteristics to provide solutions for resistance to plant diseases and pests, to increase tolerance to environmental stress, to improve quality and yields, and to meet consumer expectations.

Breeders often make crosses between plants of diverse genetic makeup to produce new combinations of genetic characteristics which result in diverse morphological or quality characteristics in the progeny plants. The natural diversity of different sources of germplasm within a species or its close relatives is a primary source of genetic variation.

Genetic variation can also be increased by mutations – changes in the DNA sequences of the plants. In plants, spontaneous mutation mechanisms and induced mutagenesis (e.g. chemical and irradiation) have long been exploited to introduce different types of mutations that confer desirable traits to breeding programs. Such mutations may range from point mutations, which include substitutions, insertions and deletions of one or a few DNA base-pairs, to larger changes including gene duplications and chromosomal rearrangements. Since the 1950s, well over 3,200 crop varieties have been directly developed by mutation breeding.

Genetic engineering is a tool to further assist plant breeders to develop plants with desired traits and has been used successfully in agriculture for over 20 years. Globally, plantings of biotech crops have increased from 1.7 million hectares in 1996 to 189.8 million hectares in 2017, and such crops are now being used by up to 17 million farmers in 24 countries. Indeed, biotech crops have been the fastest adopted crop technology in the history of modern agriculture.<sup>1</sup>

Plant breeders use common and well-established practices to evaluate the quality and safety of new varieties introduced into the market. Every commercial variety is checked over several generations for safety prior to launch. All foods introduced on to the Australian and New Zealand market are also subject to food safety recall and misleading and deceptive labelling requirements.

In addition to this, numerous regulatory authorities worldwide that have assessed GMOs for commercial release have concluded that these products present no unique risks to human or animal health or to the environment and are as safe as other plant breeding methods. These groups include official commissions, scientific bodies, and government regulators (including the Australian Office of the Gene Technology Regulator (OGTR) and Food Standards Australia New Zealand) and international organisations, such as the OECD and the Codex Alimentarius, which are staffed with experts from all relevant disciplines.<sup>2</sup>

The OGTR in particular is responsible for protecting the health and safety of people and the environment by identifying risk posed by or as a result of gene technology in Australia and manages those risks through various processes.

GMOs approved by the OGTR for commercial release in Australia are recognised as being just as safe for the environment and fit for human consumption or use than those produced through non-GM methods and conventional breeding techniques.

The ASF believes that the current ban on dealings with GMOs in South Australia is denying SA growers and agricultural companies access to already approved technologies in Australia which the other States have adopted, including the use of specific weed and pest control products which could all result in having better quality products for consumers, farmers and the processing value chain in the State.

## SOUTH AUSTRALIA TRANSPORT BAN

The South Australia *Genetically Modified Crops Management Act 2004* (the Act) was introduced to regulate and protect the cultivation and marketability of non-GMO crops in the State.

The ASF would like to inform the Committee that the current restrictions outlined in the Act on gene technology dealings in South Australia are imposing a logistical constraint on the operations of plant breeders who are involved in this market sector, including significant additional costs being imposed on members who are actively working to supply the legal seed for sowing market nationally. The South Australian Government maintains a total ban on the transport of GM seed and grain through the State. This ban applies even to those products – including Roundup Ready canola – that have been approved for legitimate commercial release in Australia by the OGTR. We are not sure that this was the intention of the initial drafters of the moratorium legislation, but the result of subsequent amendments to Commonwealth legislation. This could be easily addressed.

This ban is affecting the industry's ability to source seed from production areas and to transport it within a timely and cost-effective manner to consumers around Australia. GM canola approved for planting in Australia cannot be transported directly by truck across the country with the SA transport ban in place. It must either be sent by road around to Western Australia via the Northern Territory, shipped via sea around South Australia, or air freighted. All of this adds time and increased costs which not only affects ASF members in WA and the Eastern areas but the entire seed supply chain particularly in South Australia, as it is likely the increased costs are being passed on to all Australian consumers and all Australian canola growers.

Quality testing of seed has also been affected, with seed companies now having to send GM seed to testing labs further afield for results. This is affecting ASF members' economic bottom line and puts us at a disadvantage trade-wise in reacting to market demand. All seed laboratories in South Australia should have the ability to test genetically modified seed for standard quality parameters.

We would also like to point out the transport ban imposed on South Australia is affecting free trade among States and would question whether it is consistent with Section 92 of the Australian Constitution which requires that the "trade, commerce, and intercourse among the States, whether by means of internal carriage or ocean navigation, shall be absolutely free".<sup>3</sup>

The final report from the Productivity Commission Inquiry into the Regulations of Australian Agriculture from November 2016 also recommended that "*the New South Wales, South Australian, Tasmanian and ACT Governments should remove their moratoria on GM crops.*" The ASF supports this recommendation and calls for an immediate lifting of the GMO transport ban as a first step.

## IMPACT TO THE SEED AND AGRICULTURE INDUSTRY

The Australian seed industry has a demonstrated history of segregating varieties where GM and non-GM produce in other states has been grown and can survive equally in the one state. The ASF believes if the Genetically Modified ban on crops were lifted in South Australia it would allow farmers and seed companies to have a choice and would create equal trade of GM and non-GM produce in the State and also allow for more competition nationally and internationally. The South Australian Government argue having the imposed ban is a

<sup>3</sup> Australian Government. Commonwealth of Australia Constitution Act (The Constitution). Act No. 84 of 1977. 'Section 92 Trade within the Commonwealth to be free'

point of difference in the State being GM free and claims local farmers receive better prices however there is no scientific data or evidence of financial benefit to the State to prove this theory.

In March 2018, Mecardo conducted a market analysis report commissioned by Grain Producers South Australia and the Agricultural Biotechnology Council of Australia, on price premiums under the South Australian GM moratorium and found no evidence of substantive premiums to growers as a result of the ban. They concluded in there being no financial reason to continue the moratorium in South Australia<sup>4</sup>.

The Productivity Commission found that “the regulation of genetically modified organisms (GMO) for marketing purposes where there is evidence that industry (both in states without regulatory restrictions and internationally) can successfully manage the coexistence of GM and non-GM crops. Furthermore, the report outlines there is limited evidence of GMO-free marketing benefits at the bulk trade level.<sup>5</sup>

The South Australian Government have ignored the advice and findings of the GM Crops Advisory Committee which was formed in 2007 to review the legislation on the *Genetically Modified Crops Management Act 2004*. In February 2008 the scientific committee “recommended the lifting of the current moratorium in SA, except on Kangaroo Island”<sup>6</sup>. However, the SA Government decided to extend the moratorium on commercial GM crops claiming for marketing benefits and furthermore have also banned the transport of GM seed packed into sealed contained bags throughout the State.

It is an inherent right for South Australia farmers and supply chains to make choices from technologies which are available in other states of Australia and to its competitors internationally. Currently, with regard to innovations in agricultural biotechnology this right does not exist. For example, In June 2004, CSIRO and the Grains Research and Development Corporation (GRDC) joined forces to establish the Crop Biofactories Initiative (CBI), an innovative program with a 12-year timeframe. The aim of the \$15 million investment was to establish and develop a commercially viable plant-based industrial oils industry by 2020. The industry being based on the introduction of new high value oilseed crops which could be adopted by farmers throughout the grain growing regions of Australia, including South Australia.

From this initiative two new high value crops have been released. The first is a canola crop which can produce Omega 3 oil and meal for use in a range of high value uses including food production and as a feed for the seafood industry. The second crop is super high oleic safflower which produces an oil which will be targeted for use in the high value oleo chemical industry, where it will replace current sources of oleic oil such as environmentally sensitive palm oil. The oil will be used for products such as lubricants, transformer oils, cosmetics and medical uses.

Under the current moratorium, even though South Australia farmers have contributed to the development of these two crops through the levies they have paid to GRDC, they are unable to benefit from these crops in their rotations due to the current status of the moratoriums. In the case of the super high oleic safflower, the irony is that the traditional home for growing safflower in Australia has been the south-east of South Australia.

## CONCLUSION

The ASF's view is that having this moratorium in place means that there is continued restriction on the growth of the seed industry in South Australia and less opportunity for South Australian growers to access current and new plant breeding technology advancements which other States are adopting and using in the marketplace. The demand for GM seed is continuing to increase both nationally and globally, however SA growers remain at a disadvantage. In light of this, the ASF supports the view that South Australia should remove its moratorium on GM crops to allow seed companies and farmers to have a choice in producing GM or non-GM produce. The seed industry is confident that market choice can be delivered, as has been demonstrated in other States where GM and non-GM crops are both being grown.

In particular, the ASF would like to see the transport ban of GM through the state of South Australia immediately removed. By default, the moratorium has restricted and impacted transport of approved GM canola technologies to parts of Australia. Removal of the transport ban will further support the seed industry in meeting the needs of consumers and safeguarding seed supply throughout the country.

All seed testing laboratories in South Australia should also have the ability to test genetically modified seeds for the standard seed quality parameters.

The reasons from the State Government in South Australia maintaining a GM moratorium in place, and by default also having a transport ban of GMOs, are not valid as there has been market analysis research conducted that clearly demonstrates that there is no significant evidence supporting the claims of a marketing advantage of price premiums to SA farmers resulting from this moratorium. Indeed prices for non-GM products are higher in other States which are also growing GM crops – proof that coexistence does work and that the Australian industry can deliver market choice.
